                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      S
                                                                                                                                       An oligomer has been developed which is capable of inhibiting expression of an interleukin gene. The interleukin gene is preferably an interleukin contains a preferably an interleukin contains a contained by the contained of the preferably an interleukin contained by the contained analogue. The oligomer can be an oligomuclectide analogue it is selected from protein nucleic acid, morpholino, methylene linkage, contained, and pteridine oligonuclectide analogues. The analogue is contained at its 5' end or 3' end to an intercalator. The intercalator is a psoralen or acridine derivative. The oligomer is preferably an continuation of the protein and contained is a phosphodiester, contigonucleotide derivative, especially a phosphodiester oligonucleotide. The oligonucleotide is at least 5 (preferably 5-50) nucleotides, in contigonucleotide of the present sequence represents a specifically claimed coligonucleotide of the present invention. The oligomer can be used to alleviate inflammatory polyarthopathy, especially that associated with the contained arthritis. The oligomer can be used to alleviate inflammatory polyarthopathy, especially that associated with the contained arthritis.

                                                                                                                                                                                                                                                                 Primers AAV10465-V10492 are used to amplify regions of the human osteosarcoma cell lines MG-63 and SAOS-2 which contain ligands and growth factors and have been designed to cross intron/exon boundaries. The products are used in a process for propagating and maintaining the immature morphology of mammalian haematopoietic cells. The process involves obtaining an enriched population of mammalian haematopoietic cells having the immature morphology of CD34+, HLA-DR+, Thy-1+ and Linand co-culturing this population in the presence of osteoblast cells for between 2 weeks and 8 weeks. The immature cells can be detected by exposing them to an anti-CD34 antibody immunoreactive with the haematopoietic cell antigen CD34, and removing cells that do not immunoreact with the antibody. Such haematopoietic cells can be infused into the blood stream or bone-marrow cavity to treat blood disorders

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel method for identifying an inhibitor potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is considered to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene cristive on at least one but less than all allelic form present in the normal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premallgnant metaplastic or dysplastic cancers, benign tumours, endometriosis, polycystic kidney disease, and
                                                                                                                                                                                                                                                                                                                                Query Match

This invention describes a novel method for identifying an inhibitor optentially useful for treatment of cancer, where the inhibitor is active con a gene vital for cell growth or viability, and where the gene is consisted to loss of heterozygosity (LOH) in a cancer. The inhibitor is consect to loss of heterozygosity (LOH) in a cancer. The inhibitor is consect the generous condition, by administering to the patient a first allele consected in inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic colls of the patient are heterozygous for the first gene, the inhibitor colls of the patient are heterozygous for the first gene, the inhibitor colls of the patient are heterozygous for the first gene, the inhibitor colls of the genetive on at least one but less than all allelic forms of the gene constitute on at least one but less than all allelic forms of the gene constant somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic constant versus host disease. The method can also be used to remove consignant cells from bone marrow transplants. AAZ25812-Z26825 represent to the method of the invention to the invention constant cells described in the method of the invention constant cells described in the method of the invention constant cells described in the method of the invention constant cells described in the method of the invention constant cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC potentially useful for treatment of cancer, where the inhibitor is active CC on a gene vital for cell growth or viability, and where the gene is CC subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is CC used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele greenific inhibitor (ASI) targeted to an allele of a first essential gene CC present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor CC is active on at least one but less than all allelic form present in the green tin a population and targets only one allelic form present in the crossler in a population and treatment of LOH disorders, e.g. CC cancers, atherosclerotic plaques, prevention and treatment of LOH disorders, e.g. CC cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic lesions, benign tumours, endometriosis, polycystic kidney disease, and graft versus host disease. The method can also be used to remove
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                               cc on a gene vital for cell growth or viability, and where the gene is cc subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is cc used for preventing the development of cancer in a patient having a cc precancerous condition, by administering to the patient a first allele cc precent in cells of the precancerous condition, where the normal somatic cc present in cells of the precancerous condition, where the normal somatic cc lls of the patient are heterozygous for the first gene, the inhibitor cc active on at least one but less than all allelic forms of the gene crownal somatic cells, and the first gene. The products and methods can be cused in the diagnosis, prevention and treatment of LOH disorders, e.g. cc cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic clesions, benign tumours, endometriosis, polycystic kidney disease, and cc malignant cells from bone marrow transplants.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel method for identifying an inhibitor CC potentially useful for treatment of cancer, where the inhibitor is active CC on a gene vital for cell growth or viability, and where the gene is CC subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is CC used for preventing the development of cancer in a patient having a CC precancerous condition, by administering to the patient a first allele CC specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic CC cells of the patient are heterozygous for the first gene, the inhibitor CC is active on at least one but less than all allelic forms of the gene CC present in a population and targets only one allelic form present in the cormal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. CC cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic clesions, benign tumours, endometriosis, polycystic kidney disease, and CC graft versus host disease. The method can also be used to remove the mail grant cells from bone marrow transplants. AAZ25812-Z26825 represent were considered as the stress described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is cused for preventing the development of cancer in a patient having a creation condition, by administering to the patient a first allele greeancerous condition, by administering to the patient a first allele concerns to really soft the precancerous condition, where the normal somatic colls of the patient are heterozygous for the first gene, the inhibitor calls of the patient are heterozygous for the first gene, the inhibitor calls of the patient are heterozygous for the first gene, the inhibitor calls contain a population and targets only one allelic forms of the gene contains somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic concerns, benign tumours, endometriosis, polycystic kidney disease, and can also be used to remove malignant cells from bone marrow transplants. AAZ25812-Z26825 represent concerns and contains and

This invention describes the isolation of novel human polynucleotides encoding glypican-related proteins, glypican-6 (GPCG) and glypican-4 (GPC4). The invention also describes the polynucleotide and encoded protein sequences of glypican-1 (GPC1), glypican-3 (GPC3) and glypican-5 (GPC5). The products of the invention can be used to diagnose and treat
                                                                                                                                                                                                 e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ន្តន្តន្ត
                                                                        This oligonucletide is complementary to a portion of DNA sequence (see CANV11743) coding for the P30/PHAPI (see AAW84053) of the newly identified CV 3loop HIV receptor. It is used as a sense primer, together with an CV antisense primer (see AAV71752) in a PCR amplification of P30/PHAPI CY reverse-transcribed mRNA. The V3 loop HIV receptor consists of an CV association of 3 proteins, named P95/nucleolin, P40/PHAPI and P30/PHAPI CY (see AAW84052-54). A method for screening molecules that modulate the CV expression of the receptor comprises: cultivating cells transfected with CY a nucleotide sequence encoding P95/nucleolin, P30/PHAPI or P30/PHAPI (c) placed under the control of its own promoter; bringing the cells into CV placed under the control of its own promoter; bringing the cells into CV contact with a test molecule, and quantifying expression of the CV p95/nucleolin, P30/PHAPI or P40/PHAPI e.g. by quantitative PCR using the CV p95/nucleolin, P30/PHAPI or P40/PHAPI e.g. by quantitative pCR using the CV primers provided (see AAV71749-54). Active molecules that have the CV primers provided (see AAV71749-54). Active molecules that have the CV ability to alter and/or prevent the binding of the HIV receptor to the CV of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Best Local Similarity 81.0 Matches 17; Conservative

                                                                                      associated bone marrow hypoplasia (e.g. aplastic anemia following themotherapy or bone marrow transplant) may be effectively treated with the antibody compounds as well as disorders such as disseminated intravascular coagulation (DIC), immune thrombocytopenia (HIV-induced and non HIV-induced), chronic idiopathic thrombocytopenia, congenital thrombocytopenia, thrombotic thrombocytopenia and myelodysplasia. They can also be used in e.g. myelotoxic chemotherapy for treatment of solid tumours or leukaemia, myeloablative chemotherapy for autologous or allogeneic bone marrow transplant, myelodysplasia, idiopathic aplastic anemia, congenital thrombocytopenia, and immune thrombocytopenia. The antibodies which bind to the MuSK receptor can be used for improving neuromuscular function in a patient, e.g. in muscular dystrophy. The products can also be used for detection and diagnosis. The antibodies have a longer half-life than the natural ligand for the TPO-R. Sequences
                                                                                                                                                                                                                                                                                                                                                             thrombopoietin receptor (TPO-R). The antibodies which bind the TPO-R can be used in the same way and for the same indications as thrombopoietin (TPO). They can stimulate proliferation, differentiation or growth of megakaryocytes. They may also be able to stimulate megakaryocytes to increase platelet production. They can be used for treating immunological or hematopoietic disorders, especially thrombocytopenia. Thrombocytopenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 megakaryocyte; platelet; immunological; hematopoietic; thrombocytopenia; bone marrow hypoplasia; disseminated intravascular coagulation; anemia; myelodysplasia; myelotoxic chemotherapy; leukaemia; tumour; MuSK; CDR; neuromuscular; muscular dystrophy; complementarity determining region;
                                    AAX32387-X32413 represent DNA fragments encoding the CDR1, CD regions of variable heavy (VH) chains and variable light (VL) antibodies Ab1 to Ab6
                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an agonist antibody (Ab) which binds thrombopoietin receptor (TPO-R). The antibodies which bind the

밁
    CC separated by a 1.1 kb intron, and exons 2 and 3 are separated by a 1.6 kb cc intron. The DLX3 gene has been localised to chromosome 17q20-21. The DLX3 grotein has a molecular weight of 32kb. The dlx genes are thought to cf function in the normal cranifacial development and the development of cc mormal dentition. Tricho-Dento-Osseous syndrome (TDO) is an autosomal considered by abnormal hair, teeth and bone. Studies con TDO patients show that they have a mutated form of DLX3 called cc on TDO patients show that they have a mutated form of DLX3 called cc products, this results in a frame shift causing the DLX3delta protein (AAY9927) to be a truncated form of DLX3. The nucleotide and amino acid sequences of both DLX3 and DLX3delta can be used in the development of cc products for enhancing growth, development and repair of osseous structures, particularly for treating bone defects especially in TDO cc sufferers. Addition of DLX3delta proteins and DLX3delta-encoding nucleic caids should be arve to enhance bone thickness and increase bone density at the sites of application. Exogenously added DLX3delta proteins and CC bone/osseous defects secondary to trauma, such as broken bones. Finally, the DLX3delta proteins and nucleic acids should also have utility in the treatment of constituent of defects secondary to certain pathologies, such as contains and afforts and affo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT 3254
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PCR primers AAZ06693-Z06694 are used to amplify the coding sequence of DLX7. DLX7 is a member of the distal-less homeobox gene family. DLX7 is used in the isolation of DLX3 (AAZ06690). The DLX3 gene consists of three exons with the homeobox contained in exons 2 and 3. Exons 1 and 2 are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated DLX3 proteins and nucleic acids, used to develop products for enhancing growth, development and repair of osseous structures, particularly for treating bone defects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            craniofacial development; Tricho-dento-osseous syndrome; TDO; abnormal hair; teeth; bone; osseous structure repair; bone defect; bone thickness; bone density; broken bone; periodontal disease;

                                                                                    This oligonuclectide was used to generate a variant anti-CD3 antibody

(Ab) heavy chain in a new method for preparing a multispecific Ab

comprising a first polypeptide (PP) and at least 1 extra PP, where: (i)

the first PP comprises a multimerisation domain (MD) forming an interface

positioned to interact with an interface of a MD of the extra PP; and

(1i) the first and extra PPs each have a binding domain, which comprises

ca heavy chain and a light chain, where the variable light chains of the

first and extra PPs comprise a common sequence. The method comprises: (a)

culturing a host cell comprising nucleic acid encoding the first PP and

cextra PP, and the variable light chain, such that the nucleic acid is

expressed; and (b) recovering the multispecific Ab from the culture. The

method prepares heteromultimerric PPs, such as bispecific Abs, bispecific

cundesired formation of the desired heteromultimer relative to the

cundesired heteromultimers and homomultimers. The method allows for the

cundesired heteromultimers and homomultimers. The Abs can be used in

cundiscired heteromultimers and homomultimers. The Abs can be used in

cundiscired heteromultimers in vitro or in vivo diagnosis of various
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ; *
                                                                                                                                This sequence represents a PCR primer for DNA encoding a turkey coronavirus (TCV) S1 protein. The invention relates to an isolate of TCV obtained from a turkey having spiking mortality of turkeys (SMT) or obtained from an animal exposed to the turkey, which isolate is adapted to cell culture. The TCV and bovine coronavirus isolates are useful for forming vaccines or immunogenic compositions useful for preventing or inhibiting SMT. SMT is a form of poult enteritis and mortality syndrome and causes diarrhoea in turkey poults. The methods are useful in diagnosis and detection of turkey coronavirus associated with SMT. The oligonucleotides are useful as primers for amplification of the coronaviruses, which is useful for detecting the replication or presence of a virus in a sample. N.B. The protein encoded by the amplified sequence is referred to in the specification, but is not given in the

The antisense oligonucleotides may be derived from sequences AAX55180-271) can be used for the antisense treatment of CC diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and inflammation, including lung CC diseases, pulmonary vasoconstriction, inflammation, including lung CC diseases, pulmonary vasoconstriction, inflammation, respiratory CC distress syndrome, pain, cystic fibrosis, pulmonary hypertension, CC gulmonary vasoconstriction, emphysema, chronic obstructive pulmonary CC disease (COPD), and cancers such as leukemiae, lymphomae, carcinomas e.g. CC colon cancer, breast cancer, lung cancer, pancreatic cancer, metastases, as CC well as all types of cancers which may metastasize or have metastasized to the lungs, including breast and prostate cancer

                                                                                                                                                                                                                                                                                                                                  used in an assay to screen for compounds that change its binding activity to its receptor. The ligand can also be used for treating HIV infection and AIDS. The present sequence represents a PCR primer used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     G protein-coupled receptor protein; APJ; central nervous system; circulation; immune function; gastrointestinal function; reproduction; metabolic function; HIV; infection; AIDS; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a ligand polypeptide for the G protein-coupled receptor, APJ. The APJ ligand can modulate central nervous system function, circulatory function, immune function, gastrointestinal function, metabolic function and reproductive function. An antibody against the APJ ligand can be used in diagnosis. The APJ ligand can be

alpha (TNF-alpha) gene in an animal, preferably a human, comprise 12-50
nucleotides, 90% of which are complementary to a region of mRNA
containing a GGA sequence motif. The ASO is used to inhibit expression
of a gene in an animal and for treating the animal when afflicted with a
disease or disorder characterised by the presence of an mRNA from a gene
containing a GGA motif. The ASO are specifically targeted to a GGGA
sequence motif found in mRNA from a gene. A study of known ASO has shown
that at least half of the most efficacious ASO's contain one or more TCCC
motifs. This ASO was designated TJU-2826 and corresponds to a region of
            03-AUG-1998;

```
Ce e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, crimpeded respiration, respiratory distress syndrome, pain, cystic certificons, pulmonary hypertension, emphysema, chronic obstructive pulmonary hypertension, emphysema, chronic obstructive containmants, and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including contens and prostate cancer. The reduction of the adenosine content of the CONs reduces side effects. The A-containing ONs break down with the crelease of deoxyadenosine which activates adenosine receptors causing connchoconstriction and inflammation. AAA32313 to AAA35312 represent the nucleotide sequences given in the sequence listing from the present content on, which correspond to SEQ ID NO:1 to 2815, and then the last 185 equences are also called SEQ ID NO:1 to 185, but the sequences differ correspond to called SEQ ID NO:1 to 1860 (AAA32323 to AAA3392) are specifically claimed ONs from the present invention N.B. Sequences given in the disclosure of the present invention do not match contained the corresponding SEQ ID NO: sequences given in the sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        nucleic acids involved in bronchoconstriction, diretyres, directions are inflammation. The ON can have antiinflammatory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating effects afflict the lungs of a subject. They can be used for treating and the subject of the lungs of a subject.
                                                                                             Sequence 21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        vasoconstruction,
bronchitis, emphy

The method includes using coating liquid to drop the specific probe onto a detecting membrane (the salt concentration of coating liquid is higher than 2M and the membrane is a high-molecular polymer with average pore size of 1-10 microns); putting one end of the membrane in the liquid containing amplified polymerase chain reaction (PRR) product, and detecting if the amplified PCR product is hybridised with the probe. A reagent box is also disclosed to efficiently and quickly detect Trachoma chlamydia, Mycobacterium tuberculosis, Hepatitis B virus and Hepatitis C virus. AZ288369 to AAZ88383 represent specifically claimed oligonucleotides used in the exemplification of the present invention
                                                                                                                                                                      07-OCT-1998;
28-DEC-1998;
17-MAR-1999;
Nucleic acids encoding mutant CD36 proteins useful for preventing, diagnosing and treating parasitic infections, especially malaria.

CC integree the invention describes (B). Parasites such as plasmodium
CC encoding mutant CD36 proteins (B). Parasites such as plasmodium
CC falciparum (the major cause of malaria) are unable to utilise the mutated
CC proteins to gain entry to, and infect cells. The mutant CD36 proteins do
CC cells. The nucleic acids may be used for the recombinant production of
CC mutant CD36 proteins according to standard methodologies. They may be
CC used in this way to prevent and treat parasitic infections that utilise
CC colls (protein to infect cells, such as P. falciparum, the major cause
CC of CD36 protein to infect cells, such as P. falciparum, the major cause
CC of CD36 protein to infect cells, such as P. falciparum, the major cause
CC of CD36 expression and activity or a patient's CD36 DNA may be screened
CC to determine whether there are any mutations present that may confer
CC resistance to parasitic infections. The proteins and nucleic acids may
CC also be used to prevent, diagnose and treat diseases associated with
CC defects in insulin action and/or glucose metabolism and/or fatty acid
CC metabolism and/or catecholamine action in subjects possessing mutations
CC in the CD36 genes. AAA40606 to AAA40759, and AAB02515 to AAB02564,
CC represent nucleotide and amino acid sequences respectively which are used
CC in the examilition of the present invention the exemplification of the present invention invention describes isolated nucleic acid molecules æ

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical

                                                                        AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ65579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses; they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.                                                                                                                                                         AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment. AAZ69579 to AAZ7440 represent amplification controlled sequences. AAZ69579 to AAZ77440 represent amplification comprises for the biallelic markers. The bhallelic markers of the invention have a variety of uses they can be used for high density mapping of the comman genome, and in complex association studies and haplotyping studies compositions and methods of the invention can also be useful for the compositions and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from the confidence of the confide

AAZ69579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   genomic map; haplotype; phenotype; polymorphic base; genotyping haplotyping; hybridisation; identification; characterisation; amplification; single nucleotide polymorphism; SNP; PCR primer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of Phytolacca americana (Virginian pokeweed), to cDNA encoding it (AAA97476), to the processes and primers used to clone the AFP cDNA from (Yayanian pokeweed seed total mRNA, and to its IPTG-inducible recombinant production in Escherichia coli. Pa-AFP has activity against such fungi as Rhigoctonia solani (black scurf of potato) and may therefore be useful in agriculture. Sequences AAA97477-A97482 represent PCR primers used to introduce restriction sites into cDNA encoding Pa-AFP in the cloning

The present invention describes low adenosine (A) content antisense CC oligonucleotides and compositions (I) comprising them. In the antisense CC oligonucleotides the A is replaced by a 'Universal' or alternative base. CC (I) can have respiratory, bronchodilator, antiinflammatory, analyssic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. CC The antisense oligonucleotides and (I) can be used to down-regulate the CC expression and or activity of target polypeptides associated with CC lung/respiratory disorders and malignancies, such as stimulating and CI cambodines, endogenously produced specific and non-specific enzymes, communoglobulins and antibodies, antibody receptors, cytokines and CC chemokine receptors, adenosine receptors, bradykinin receptors, cytokine and CC chemokine receptors, adenosine receptors, bradykinin receptors, cytokine and CC receptors, CNS and peripheral nervous and non-specific enzymes, cc including proteins and malignancy associated proteins. The CC including proteins and malignancy associated proteins. The CC including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or surfactant hypoproduction which are associated with a disease or cc condition selected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary consent and antisense oligonucleotides used in the exemplification of the present human polymucleotide
CC response and malignancy associated with a disease (COPD), pulmonary transplantation rejection, pulmonary infections, bronchitis, and/or cancer. AAF18434 to AAF21543 represent human polymucleotide from pulmonary consent human polymucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosts and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acid selected from one of 106 genes comprising single nucleotide polymorphisms, allele-specific oligonucleotides to the genes are useful for phenotypic correlations, forensics, paternity testing, medicine and

       This sequence represents a target sequence for a microsphere genosensor created using the composition of the invention. The invention relates to a composition which comprises a substrate (other than a fibre optic bundle) with discrete sites on its surface, and microspheres distributed at these sites. The microspheres comprise at least two subpopulations, each with a bioactive agent and an optical signature that identifies the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosts and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                    Composition comprising microspheres with a signature, at discrete sites on substrate, analytes, e.g. nucleic acids.

                                       The present sequence is an antisense oligonucleotide directed at the human testosterone-repressed prostate message-2 (TRPM-2, also known as clusterin, sulfated glycoprotein-2 or SGP-2). The sequence was shown to promote the regression of tumours, and oligonucleotides directed at human TRPM-2 can be used in the treatment of tumour cells expressing the TRPM-gene. These include prostate cancer, renal cell cancer and some breast cancer cells. In addition to this, they also increase the chemosensitivity of the cells, meaning that conventional chemotherapy is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (examples include AAA10964-A10968) to the microsphere surface chemistry. A fluorescent dye molecule is attached to the target sequence (examples include AAA10969-A10973) which is in solution. The optically interrogatable signal change occurs with the binding of the target sequences to the microsphere. The composition of the invention is used to detect target analytes and screen large libraries of bioactive agents for those (potential drugs) that bind to the target analytes e.g. pollutants; solvents; therapeutic or illicit drugs; hormones; cytokines; nucleic acids (detecting genes associated with cancer, Alzheimer's disease or cystic fibrosis), antigens; whole cells; to screen foods and water for toxic bacteria; for forensic DNA fingerprinting, for sequencing and for

                                                                                                                                                                                                                                                                                                                 array with a sample, measuring the optical response of each microsphere sensor element, and performing statistical analysis on the measured optical response of the subpopulations. The method is used for detecting target analytes such as nucleic acids, proteins, hormones, lipids, carbohydrates, whole cells, environment pollutants and drugs. The method is inexpensive when compared to conventional methods. The array once loaded can be decoded or used after testing. The present sequence represents a probe used to detect the presenc of a disease- associated gene fragment in an exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method for detecting a target analyte in a sample using a self-encoding sensor array comprising a population of microspheres on discrete locations on the surface of a substrate. The array has several subpopulations of microspheres, each of which provides a characteristic optical response signature when illuminated by excitation light energy in the presence of a reference analyte, which may in some cases be the target analyte. The method involves contacting the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Method for detecting target analyte in sample involves, providing array with several sub population of sensor elements, measuring optical response of each sensor element and statistically analyzing optical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Analyte detection; microsphere array; self-encoding sensor array; nucleic acid detection; biochip; disease-associated gene; probe; ss.

The carray has several subpopulations of microspheres, each of which provides a characteristic optical response signature when illuminated by excitation light energy in the presence of a reference analyte, which may in some cases be the target analyte. The method involves contacting the carray with a sample, measuring the optical response of each microsphere contacting the sensor element, and performing statistical analysis on the measured optical response of the subpopulations. The method is used for detecting target analytes such as nucleic acids, proteins, hormones, lipids, carbohydrates, whole cells, environment pollutants and drugs. The method is inexpensive when compared to conventional methods. The array once loaded can be decoded or used after testing. The present sequence conversion a target sequence which can be detected using the method of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       array with a sample, measuring the optical response of each microsphere sensor element, and performing statistical analysis on the measured optical response of the subpopulations. The method is used for detecting target analytes such as nucleic acids, proteins, hormones, lipids, carbohydrates, whole cells, environment pollutants and drugs. The method is inexpensive when compared to conventional methods. The array once loaded can be decoded or used after testing. The present sequence represents a probe used to detect the present of a disease- associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       sample using a self-encoding sensor array comprising a population of microspheres on discrete locations on the surface of a substrate. The array has several subpopulations of microspheres, each of which provides a characteristic optical response signature when illuminated by excitation light energy in the presence of a reference analyte, which may in some cases be the target analyte. The method involves contacting the

This is a crop parasite which can cause damage to crops such as potatoes, beets, black salsifies and carrots, the damage being so great that in Europe the organism has been given a quarantine status. The oligonucleotide was identified using random amplified polymorphic DNA and subjecting it to a series of sequence can be used in tests to determine both the presence and species of Meloidogyne parasites, which is useful for seed export and also in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to androgen independent, aggressively CC tumourigenic prostate cancer cell lines, CL-1 and CL-2, which are customer that lines are requence is a PCR primer CC sublines of the LNCap cell line. The present sequence is a PCR primer CC used to amplify a coding sequence expressed by the cell lines. The coding sequences which were amplified in the present invention by the primers in CC AAA76068 to AAA76107 were: beta-actin, Prostate-specific antigen (PSA), ACC AAA76068 to AAA76107 were: beta-actin, Prostate-specific antigen (PSA), CC Interleukin-8 (IL-8), Vascular endothelial cell growth factor (PSA), CC Interleukin-8 (IL-8), Vascular endothelial cell growth factor (PSA), CC Interleukin-8 (IL-8), Vascular endothelial cell growth Factor-beta2 (TGF-beta1), Transforming Growth Factor-beta2 (TGF-beta2), Transforming Growth Factor receptor (EGF-R), EC-adherin, p53, PTEN, Caveolin, c-myc, CC factor receptor (EGF-R), EC-2, E-cadherin, p53, PTEN, Caveolin, c-myc, CC HRR-2/neu and p27. RT-PCR was used to monitor changes in coding sequence expression, as the LNCaP parental lines progressed to the CL1 and CL2 sublines. The CL-1 and CL-2 sublines can be used as tools for studying the cellular machanisms of prostate cancer progression, CC such as the expression patterns of various transcripts and proceins that are associated with the progression of the non-metastatic, androgen-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Best Local Similarity Matches 17; Conserv

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the disease, stroke, peripheral vascular diseases, venous thrombosembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes an

The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular disease, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                              10-SEP-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various 'polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thrombosembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPS) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                  Key

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism; pulmonary embolism; paternity test; ds.
                                                                                                                                                                                                                                                                                                                               Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       07-SEP-2000; 2000WO-US024503

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ដ
```

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype

correlations to diseases. the human gene SNPS shown

The present in the speci

specification

genetic analysis and phenotype equence is an example of one of

                                                                                                              The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thrombosembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          10-SEP-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               disease, stroke, peripheral vascular diseases, venous thromboembolism (pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                     The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular disease, venous thrombosmbolism and disease, stroke, peripheral vascular disease, venous thrombosmbolism and
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and atherosclerosis.

                                                                                                                              The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thrombosembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                        Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and

                                                                                                                                                                             The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and disease, stroke, peripheral vascular diseases, venous thromboembolism and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; variant thrombospondin 1; variant thrombospondin 4; polymorphism; vascular disease; coronary artery disease; for myocardial infarction; atherosclerosis; stroke; venous through pulmonary embolism; paternity test; ds.

                                                                                                                                                                                                                                                                                                                                                           DNA sequences AAH62100 - AAH62688 represent segments of human genes which contain single nucleotide polymorphisms (SNPs). A method is included in the invention for analysing an nucleic acid sample, which consists of determining the base occupying any one of the polymorphic sites given in the SNP containing sequences. The nucleotide sequences can be used in the diagnosis or monitoring of diseases, such as cancer, inflammation, heart diseases, diseases of the cardiovascular system, and infection by microorganisms. The oligonucleotides are also useful in the manufacture of a medicament for the treatment or prophylaxis of the diseases, and as a pharmaceutical. SNP containing oligonucleotides are useful in applications such as phenotype correlation, forensics, paternity testing, medicine and containing oligonucleotides are useful.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Single

A method is included in the invention for analysing a nucleic acid sample, which consists of determining the base occupying any one of the polymorphic sites given in the SNP containing sequences. The nucleotide sequences can be used in the diagnosis or monitoring of diseases, such as cancer, inflammation, heart diseases, diseases of the cardiovascular system, and infection by microorganisms. The oligonucleotides are also useful in the manufacture of a medicament for the treatment or prophylaxis of the diseases, and as a pharmaceutical. SNP containing oligonucleotides are useful in
                                                                       Key

A method is included in the invention for analysing a nucleic acid sample, which consists of determining the base occupying any one of the polymorphic sites given in the SNP containing sequences. The nucleotide sequences can be used in the diagnosis or monitoring of diseases, such as cancer, inflammation, heart diseases, diseases of the cardiovascular system, and infection by microorganisms. The oligonucleotides are also useful in the manufacture of a medicament for the treatment or prophylaxis of the diseases, and as a pharmaceutical. SNP containing oligonucleotides are useful in applications such as phenotype correlation, forensics, paternity testing,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Secreted protein; human; PRO protein; neoplastic cell growth; tumour; proliferation; leukaemia; lymphoid malignancy; inflammatory disorder; angiogenic disorder; immunologic disorder; PRO7476; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acid segments of the human genome, particularly from genes including polymorphic sites, for phenotype correlation, forensics, paternity testing, medicine and genetic analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAA91034 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cargill M,

                                                     This sequence represents a PCR primer used to isolate DNA encoding human CC PRO7476 protein of the invention. The PRO proteins are secreted proteins. Antagonists or antibodies of PRO polypeptides are useful for diagnosing CC and treating tumours are associated with gene amplification, neoplastic CC cell growth and proliferation in mammals, and those conditions (CC characterised by overexpression and/or activation of the amplified genes. CC Such conditions include benign or malignant tumours (e.g. renal, liver, CK kidney, bladder, breast, gastric, ovarian, colorectal, prostate, CC kidney, bladder, breast, gastric, ovarian, colorectal, prostate, CC glioblastomas and various head and neck tumours); leukaemias and lymphoid cmalignancies, neuronal, glial, astrocytal, hypothalamic, and other CC glandular, macrophageal, epithelial, stromal and blastococlic disorders; and inflammatory, angiogenic and immunologic disorders. These may further CC be used to qualitatively or quantitatively detect the expression of corocteins encoded by the amplified genes, and in tumour diagnostics or preparation of a medicament in the treatment of a condition, which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           tumors are

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC disrupted, causing it to lack mature B and T cells. In particular, both alleles of the recombination activation gene-2 (RAG-2) gene are CC disrupted, which in turn prevents VDJ recombination. The mouse also CC comprises donor (e.g., human) specific transgenes encoding the cytokines (LIF), granulocyte macrophage-colony stimulating factor (SCF), leukaemia inhibitory factor (LIF), granulocyte macrophage-colony stimulating factor (SCF), leukaemia inhibitory factor (LIF), granulocyte macrophage-colony stimulating factor (GM-CSF), and IL-6, which enable it to support the growth of transplanted donor cells. In another embodiment CC finitocompatibility complex (MHC) class II DR3 molecule, where the CC histocompatibility complex (MHC) class II DR3 molecule, where the CC transgene has naturally linked DRab and DQab alleles. The transgenic CC donor, e.g., non-human, macromolecules; to determine the effect compounds have on a human immune system; to generate fully human polyclonal or CC monoclonal antibodies to specific antigens; to determine whether compounds in the investigate the human cell mediated response in a human cCC pathogens and other immunomodulatory compounds; and to determine the calls. The transgenic mouse supports the functional cCC which produce functionally impaired haematopoietic cells or are CCC monoclonal of calls. The transgenic mouse supports the functional cCC which produce functionally impaired haematopoietic cells or are couse provides in the periphery that exhibit MHC-restricted antigen- specific responses. CCC more closely resembles normal ontogeny, as they possess CD4+ T cells in the periphery that exhibit MHC-restricted antigen- specific mice used in the development of human cytokine-expressing transgenic mice
                                                                                                                                                                                                                                                                                                                       AAH23038/

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention provides a composition comprising one or more antisense oligonucleotides directed against vascular endothelial growth factor (VEGF) where the antisense oligonucleotides inhibits proliferation of cells exhibiting autocrine VEGF activity at an IC 5 0 concentration of between 0.5-2.5 micro Ma. The antisense oligonucleotides may be directed against VEGF for inhibiting cancer cell proliferation and angiogenesis. Preferably the oligonucleotide AAH23032 (a modified version of AAH22984) is used and may be utilized to treat Kaposi's sarcoma, ovarian cancer, prostrate cancer, pancreatic cancer or melanoma. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           19-JAN-2001; 2001WO-US000019

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               inflammation, matrix metalloproteinase (NMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a concleic acid molecule (II) comprising a promoter operably linked to a concleic acid segment encoding (I). (I) can have antipsoriatic, antisickling, comprising a promoter operably linked to a concleic acid segment encoding (I). (I) can have antipsoriatic, antisickling, comprising the property of the concleaves and comprising the concleaves and comprising cytokine involved in inflammation. (I) can be used compared to the concleaves RNA encoding cytokine involved in inflammation. (I) can be used compared to the concleaves such as psoriasis, atopic dermatitis, actinic keratoris, compared to the concleaves such as psoriasis, atopic dermatitis, actinic keratoris, compared to be used for treating proliferative eye diseases such as diabetic conclusions, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing compared to the conclusion of the control of the contro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match
